no need for a flashback arrestor, providing the added advantage of improved gas response. The close coupling of the electronics to the IR sensor does however limit its high temperature operation. Exceeding the operational temperature limit can cause IR sensor drift or failure.

As the detector element encounters combustible gas, the temperature of the bead increases and the resistance increases accordingly. The difference in the resistance between the detector and the reference elements is the signal representing the concentration of gas.

How an LEL sensor works. There are a pair of resistive fine-wire elements that comprise a catalytic bead LEL sensor. One of them is a reference and the other is an LEL detector. When gas that is combustible is exposed to the detector,

More sophisticated combustible gas detection vendors often incorporate multiple sensors on a single chip that can work together to measure a variety of properties of samples. This data then allows the detector to develop a rich bank of information about the chemical composition and molecules that are present.

A combustible gas detector is a device used to detect the presence of combustible, flammable, toxic, and oxygen depleting gases in an area. They are commonly used in industrial plants to detect gas leakage or buildup before it can reach an explosive level.
