Data Analysis And Approximate Models

Forgoing any concept of truth, Data Analysis and Approximate Models: Model Choice, Location-Scale, Analysis of Variance, Nonparametric Regression and Image Analysis presents statistical analysis/inference based on approximate models. Developed by the author, this approach consistently treats models as approximations to data, not to some underlying truth.

Developed by the well-regarded author, this approach discusses how analysis must take into account that models are, at best, an approximation of real data. It is, therefore, closely related to robust statistics and nonparametric statistics and can be used to study nearly any statistical technique.

Model Analyses and Guidance

A data modeller would not necessarily query or manipulate data or become involved in designing or implementing databases or data repositories. Data Modeling sometimes needs Data Analysis. BA's often need to analyse data as part of making data modeling decisions, and this means that data modeling can include some amount of data analysis.

Data Analysis and Data Modelling - What's the difference?

Data analysis is a process of inspecting, cleansing, transforming and modeling data with the goal of discovering useful information, informing conclusions and supporting decision-making. Data analysis has multiple facets and approaches, encompassing diverse techniques under a variety of names, and is used in different business, science, and social science domains.
