In extended psychoacoustic studies an optimal sound for a specific product is "tailored" and it is the task of the engineers to modify the physics of the sound generation in such a way as to arrive at a sound which is as close as feasible to the target sound. In this paper, some psychophysical methods useful for both sound quality

evaluation of sounds usually is based on physical measurements.

However, in "real life", the ultimate judge for sounds is the human hearing system. A customer evaluates the sound of a product by his or her hearing system, not by physical measurement tools, whatever their sophistication may be.
