th The technology of froth flotation, invented in the early 20 century was first used for the concentration of sulfide minerals. Since then it has been applied for the processing of many nonsulfide ores as well, including oxides, carbonates, silicates, soluble minerals like halite and sylvite and energy minerals like coal and bitumen.

FUNDAMENTAL SURFACE CHEMISTRY AND FROTH ... (specifically two types of quebracho: Tupasol ATO and Tupafin ATO) in the froth flotation process as a depressant for gangue minerals. Two ore types, copper and fluorite, were researched. The primary gangue mineral of interest was calcite for the fluorite ore, while it was pyrite for the copper ore.

The surface area of the bubbles in the froth is also important. Since particles are carried into the froth by attachment to bubble surfaces, increasing amounts of bubble surface area allows a more rapid flotation rate of particles. At the same time, increased surface area also carries more water into the froth as the film between the bubbles.
